What are we talking
about ?

Objective

Understand how **consumers** use smart fitness devices and **identify trends** Bellabeat can use to improve its **marketing strategy** and **support growth**.

The Product

Product focus: Bellabeat Leaf

Insights collected through Leaf can be translated into personalised guidance through the Bellabeat app.

The Data

Data and Tools

- Excel for initial inspection and validation
- Python for data cleaning, transformation, aggregation and analysis
- Tableau to create clear visualisations
- PowerPoint for key finding and recommendations to Bellabeat stakeholders

Data Limitations

- The dataset does not include useful demographic information such as gender or age
- The data was collected in 2016, making it outdated for drawing conclusions about current smart-device behaviour.
- The overall sample is small, which limits how confidently findings can be generalised to the wider population of smart-device users.

Finding 1: Activity peaks

Average Daily Steps by Day of Week

Finding 1: Activity peaks

- Average steps drop during the week but peak on a Saturday
- Sunday has the lowest average steps of the week

Finding 2: Users sleep

Average Sleep Duration vs Time in Bed

Finding 2: Users sleep

- Users average about 7 hours of sleep
- They spend about 40 minutes awake in bed

Finding 3: Active hours and steps

Daily Steps vs Active Hours

Steps

Linear
Correlation

More Active Hours

Finding 3: Active hours and steps

Active hours strongly relate to steps

Strong positive correlation between daily steps and active hours

Finding 3: Active hours and steps

Active hours strongly relate to steps

Strong positive correlation between daily steps and active hours

The Correlation Coefficient (r) = 0.74, showing a strong positive relationship

Finding 4: Active Hours and Sleep

Finding 4: Active Hours and Sleep

- Activity does not strongly relate to sleep
- Almost no linear relationship between active hours and sleep duration

Finding 4: Active Hours and Sleep

- Activity does not strongly relate to sleep
- Almost no linear relationship between active hours and sleep duration
- Correlation Coefficient (r) = -0.07

Finding 5: Sleep Data Is Less Complete

User Coverage by Dataset

Finding 5: Sleep Data Is Less Complete

Sleep data less complete

Activity covered 35 users, while sleep covered only 24, with some sleep averages based on very few recorded days.

Recommendations

Recommendations

Gamify movement with a virtual companion:

Convert daily steps into in-app currency to feed and customise a virtual pet. Higher activity unlocks outfits, accessories, environments, and streak rewards—giving users a compelling incentive to stay active.

Why it fits the data:

Active hours and steps showed a strong positive relationship ($r = 0.74$), suggesting that rewarding continued movement could reinforce behaviours already associated with higher step counts.

Recommendations

Drive movement through gamification - virtual pet, step currency, streaks and unlockables such as clothing.

Use personalised timing – lower-activity-day prompts, especially Sunday.

Separate activity and sleep messaging – distinct Leaf/app insights since sleep and activity were only weakly related.

Actionable Steps

Actionable Steps

- Research which virtual companions users are most likely to connect with, such as cats, dogs or hamsters.
- Test personalised Sunday movement prompts.
- Pilot the virtual-pet reward system with a small group of Leaf users.
- Track engagement, retention, streak completion and average active time.
- Collect more current first-party Bellabeat data before scaling the strategy.

Conclusion

Conclusion

Activity varies
across the
week.

More active
time strongly
aligns with
more steps.

Activity does
not strongly
predict sleep.

Leaf should encourage movement through personalised,
motivating engagement while treating sleep separately.
